 Title: Effects of warm asphalt additives on asphalt binder and mixture properties

 Keywords: Civil engineering
 Abstract: With increasing concerns of global warming and increasing emissions, the asphalt industry is making a constant effort to lower its emissions by reducing the mixing and compaction temperatures of the asphalt mixture without affecting the properties of the mix. Several proprietary chemicals are available in the industry that can help reduce the mixing and compaction temperatures. A significant reduction of required heat can be achieved in most cases. While some studies have been conducted to evaluate the properties of warm mix asphalt; properties of binders and mixtures, in fresh and aged conditions, containing these chemicals have not been studied in great detail. This research presents the results of tests conducted to evaluate the properties of warm mix asphalt binders and mixtures, in fresh and aged conditions. This study was broadly classified into two; study of binder

The response of environmental systems to climatic forcing is frequently non-linear, and the response of *managed* systems nearly always is. This is due to the existence of critical thresholds, of different types, within environmental and managed systems. The aim of this paper is to explore the nature of these thresholds in the water sector, distinguishing between the “natural” and the managed aspects of the water environment. Understanding these thresholds is important in terms of understanding and predicting the response of a system to climate change, and also in terms of assessing critical points (or “dangerous levels of change”) within a response system.
